

Tavishi Session 23

Saturday, July 18, 2026 8:38 PM

Basics

- Variables ✓
- Data Types ✓
- Type Conversion ✓
- Input and Output ✓
- Comments ✓
- Operators ✓

Control Flow

- if ✓
- if-else ✓
- if-elif-else ✓
- Nested Conditions ✓
- Match Case (optional) ✓

Loops

- for Loop ✓
- while Loop ✓
- Nested Loops ✓
- Loop Control Statements (break, continue, pass) ✓

Strings

- String Indexing ✓
- String Slicing ✓
- String Methods ✓
- String Formatting ✓

Collections

- Lists ✓ List Methods ✓
- Tuples Tuple Operations
- Sets Set Methods
- Dictionaries Dictionary Methods

Functions

- Function Definition
- Parameters and Arguments
- Return Statement
- Default Arguments
- Keyword Arguments
- Variable Length Arguments (*args, **kwargs)
- Scope (Local and Global)
- Lambda Functions
- map()
- filter()
- reduce()

Happy birthday / anything
↓
any data type

```
list = [1, 2, "azaan", "24", True, 99]
```

```
[1, 2, 'Happy Birthday', 'azaan', '24', True, 99, 'Tavishi']
```

```
# index 0 1 2 3 4 5
```

list.insert (index , value)

Tuples: It is a group of similar or different data type

→ It is immutable.

Tuple Concatenation:-

String Slicing :

String Slicing:

String: S O P H I E

Positive Indexing: 0 1 2 3 4 5

Negative Indexing: -6 -5 -4 -3 -2 -1

Diagram shows a string "S O P H I E" with positive indexing (0 to 5) and negative indexing (-6 to -1). A blue circle highlights the -1 index, with an arrow pointing to it.

Tuple_Sorting

- Arranging the element in the ascending or descending order

How to convert a list into tuple ?

list = []

tup = ()

tup = tuple (list)

list = list (tup)
